## Wk 17 Motion Equations

## 3 Solving Motion Equations

Now it's up to you to follow the process and get an answer. - Identify the variables that you are given.

- Identify what you are being asked for.
- Choose the appropriate equation.
- Plug in and solve for the answer.

1. A car starting from rest, gets up to $20 \mathrm{~m} / \mathrm{s}$ in 5 seconds. What was its acceleration?
2. What is the final velocity of a horse that starts at $4 \mathrm{~m} / \mathrm{s}$ and accelerates at $1 \mathrm{~m} / \mathrm{s}^{2}$ for 3 seconds?
3. A sprinter, starting from rest, accelerates at $2 \mathrm{~m} / \mathrm{s}^{2}$ for 3 seconds. How far did he go?
4. How long would it take a rocket to go from 100 $\mathrm{m} / \mathrm{s}$ to $200 \mathrm{~m} / \mathrm{s}$, if it accelerated at $5 \mathrm{~m} / \mathrm{s}^{2}$ ?
5. A jogger covers 20 m in 5 seconds, with an acceleration of $2 \mathrm{~m} / \mathrm{s}^{2}$. What was her initial velocity?

Make up two of your own problems - one that uses the first equation and one that uses the second.

- Identify the variables and the one to be solved for.
- Then set up the equation, but do not solve.
